**ACKNOWLEDGEMENTS**

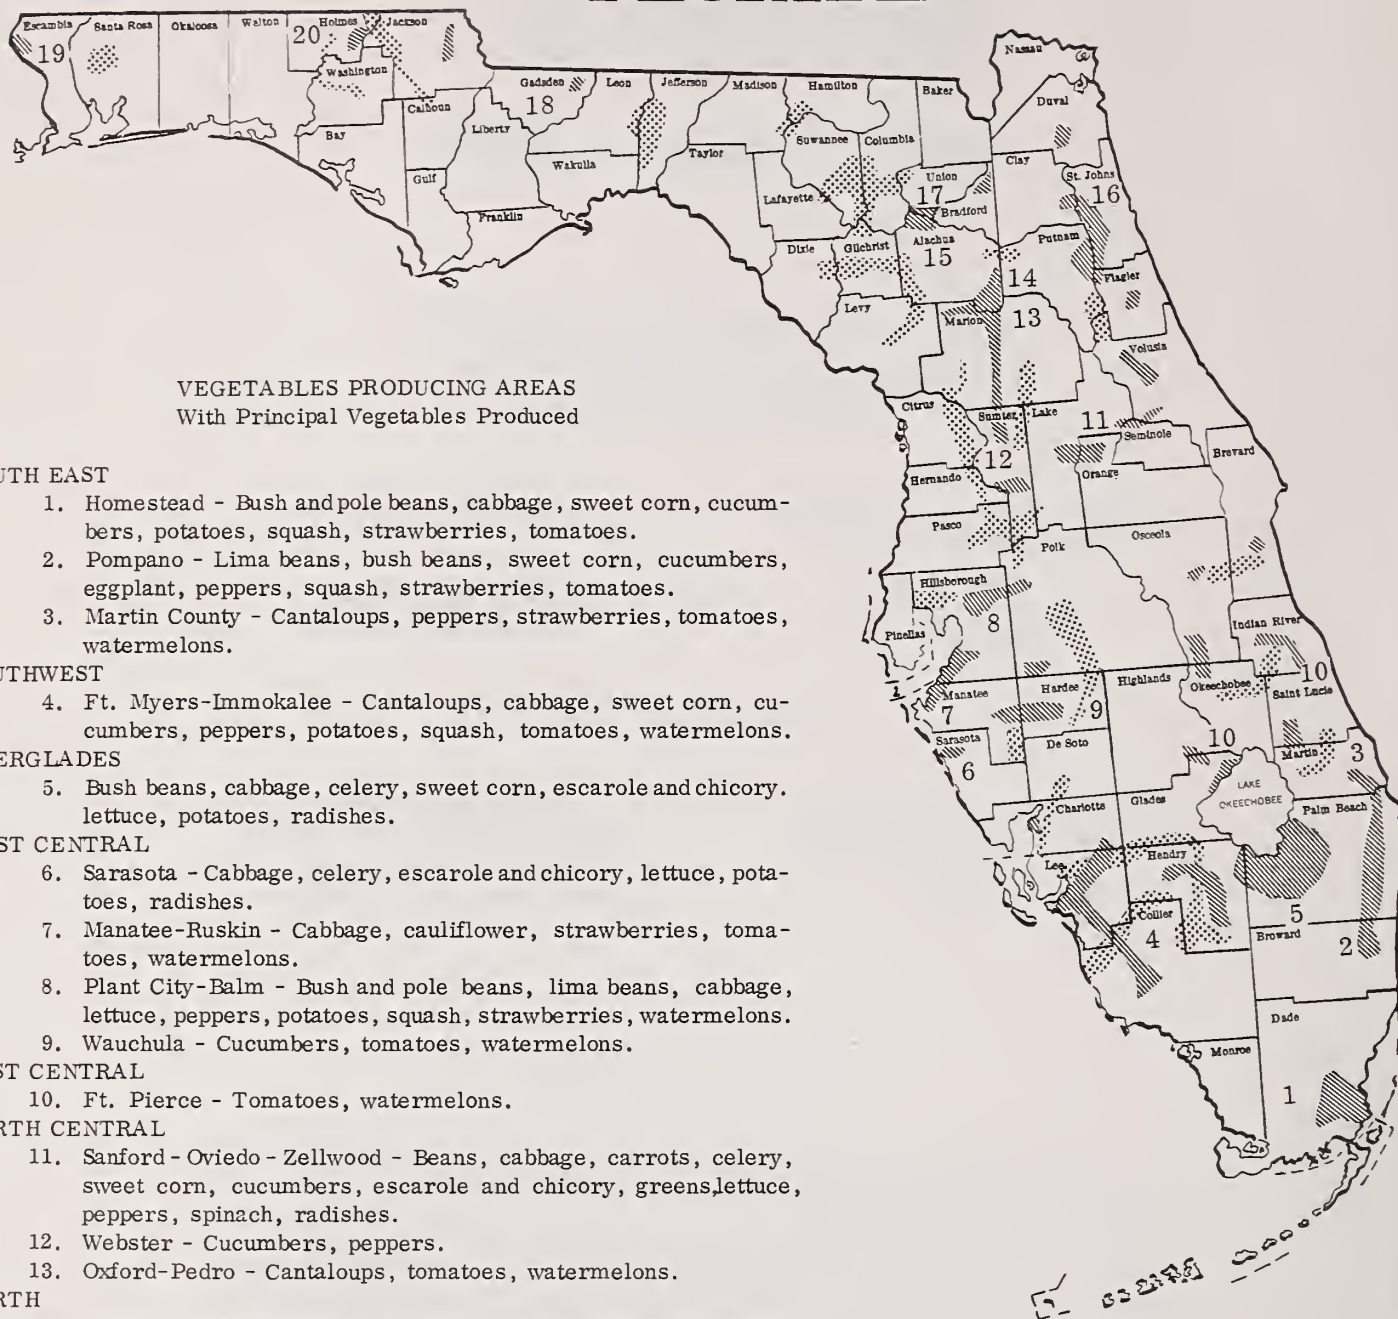

The acreage, yield, production, monthly, and season average value, and crop value statistics in this bulletin are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. The county and area detail in these statistics were made possible by the participation of the Department of Agricultural Economics, University of Florida, in the estimating program. Market price quotations and shipment statistics are from the Market News Section and the USDA Consumer and Marketing Service.

Agencies in the Florida Department of Agriculture providing basic data used in developing statistics in this summary include the Road Guard Section, Division of Inspection; State Markets Section, Celery Advisory Committee, and Sweet Corn Advisory Committee, Division of Marketing, the Plant Inspection Section, Division of Plant Industry and the South Florida Vegetable Exchange. County Agents of Florida's Agricultural Extension Service were very helpful in supplying information on vegetable production in their counties.

Growers, shippers, processors, sales agencies, and transportation firms voluntarily supplied much of the data used in developing these official statistics. This public spirited cooperation is appreciated.

## VEGETABLES PRODUCING AREAS With Principal Vegetables Produced

### SOUTH EAST

1. Homestead - Bush and pole beans, cabbage, sweet corn, cucumbers, potatoes, squash, strawberries, tomatoes.
2. Pompano - Lima beans, bush beans, sweet corn, cucumbers, eggplant, peppers, squash, strawberries, tomatoes.
3. Martin County - Cantaloups, peppers, strawberries, tomatoes, watermelons.

### SOUTHWEST

4. Ft. Myers-Immokalee - Cantaloups, cabbage, sweet corn, cucumbers, peppers, potatoes, squash, tomatoes, watermelons.

### EVERGLADES

5. Bush beans, cabbage, celery, sweet corn, escarole and chicory, lettuce, potatoes, radishes.

### WEST CENTRAL

6. Sarasota - Cabbage, celery, escarole and chicory, lettuce, potatoes, radishes.
7. Manatee-Ruskin - Cabbage, cauliflower, strawberries, tomatoes, watermelons.
8. Plant City-Balm - Bush and pole beans, lima beans, cabbage, lettuce, peppers, potatoes, squash, strawberries, watermelons.
9. Wauchula - Cucumbers, tomatoes, watermelons.

### EAST CENTRAL

10. Ft. Pierce - Tomatoes, watermelons.

### NORTH CENTRAL

11. Sanford-Oviedo - Zellwood - Beans, cabbage, carrots, celery, sweet corn, cucumbers, escarole and chicory, greens, lettuce, peppers, spinach, radishes.
12. Webster - Cucumbers, peppers.
13. Oxford-Pedro - Cantaloups, tomatoes, watermelons.

### NORTH

14. Island Grove-Hawthorne - Lima beans, snap beans, celery, squash, watermelons.
15. Gainesville-Alachua - Bush beans, cucumbers, peppers, potatoes, squash.
16. Hastings - Cabbage, potatoes.
17. Starke-Brooker-Lake Butler - Lima beans, snap beans, cucumbers, green peppers, potatoes, squash, strawberries.

### WEST

18. Gadsden County - Pole beans, squash.
19. Escambia County - Potatoes, sweet corn, peppers.
20. Holmes-Jackson-Washington Counties - Watermelons, miscellaneous vegetables.

 Commercial Vegetables

 Watermelons

FLORIDA: Usual Dates for Planting and Harvesting Vegetables,  
Melons, Potatoes, and Strawberries

Crop and Season	Planting Dates	Usual Harvest Dates		
		Begins	Most Active	Ends
Lima Beans, Spring <u>1/</u>	Sept 15 - Apr 1	Nov 1	May 1 - June 30	July 15

## DEFINITIONS AND EXPLANATIONS

This bulletin contains detailed data on acreage, yield and production for only the past 3 seasons. Prior years can be obtained from the 1968 or earlier bulletins.

A change in the definitions of harvested acreage, yield and production is the reason for the short series. Accurate estimates of acreage actually abandoned and reduced yields due to low prices or other economic factors are difficult to prepare. Quantity actually sold has the greatest significance, therefore, this is now the basis for yield and production estimates. Estimates of economic abandonment will still be made but entered in footnotes.

In the 3-year series harvested acreage, yield and production relate only to production actually marketed. Estimates for the earlier years in this series will be revised and included in a future publication. Those needing comparable historic production data can obtain them from columns labeled "quantity sold" in earlier publications.

**SEASONAL GROUPS**--Seasonal estimates are made for most of Florida's vegetable, melon, potato, and strawberry crops to show supplies for a shorter period of time than the entire marketing season. The seasonal classification used for each of Florida's crops is shown on the adjacent page along with usual planting and harvesting dates.

**PLANTED ACREAGE** is the total acreage which has been planted for harvest during one designated season. To avoid duplication, acreage lost and replanted to the same crop in time for harvest, in the same season, is counted only once.

**HARVESTED ACREAGE** is the acreage actually harvested or partially harvested. Acreage lost before or at maturity through natural causes is not included in the acreage for harvest.

**YIELD** is the average production of merchantable quality harvested and sold or utilized per acre.

**PRODUCTION** includes the quantity actually harvested and sold or utilized.

**ECONOMIC ABANDONMENT** is that portion of the crop that reached maturity and was of merchantable quality but was not harvested because of labor shortages, low prices or other economic factors, or if harvested, was not sold or utilized for those reasons.

**UNIT VALUE** for production sold on the fresh market represents the F. O. B. price received or its equivalent for all grades and quality of the commodity including selling charges. Unit value for quantities sold to processors represent prices paid on a delivered to the processing plant door basis and includes transportation cost, etc.

**TOTAL VALUE** is the value of production sold. It excludes economic abandonment, cullage, and any portion of a crop not harvested.

**RAIL - TRUCK** shipments are included in the straight rail shipments shown for each crop.

**RAIL LOAD FACTORS** -- Represents the average number of packages per rail car based on tabulation of way-bills in prior years showing the contents of each car.

**MIXED CARS (RAIL)** -- Loadings by stations are pro-rated by commodities reported and tabulated in recent years. Less than 4 percent of the total equivalent carlots of vegetables and potatoes moved in this category in 1968-69.

**TRUCK SHIPMENTS** are converted to equivalent carlots on the basis of a predetermined load factor. A minor difference of carlot equivalents in the season total obtained by adding the monthly or weekly shipments may exist because of rounding.

**PRODUCTION AND PRICE UNIT** -- The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to the most commonly used container. The following table gives the net weight used per container and the number of containers per hundredweight.

**PRODUCTION AND PRICE UNIT**  
Most Common Unit, Estimated Net Weight, Number of Units per Hundredweight,  
Principal Vegetable Commodities, Florida, 1968-69 Crop Season

## SUMMARY OF THE 1968-69 VEGETABLE SEASON

Florida vegetables, Irish potatoes, strawberries and watermelons for fresh market and processing were marketed during the 1968-69 season for a total value estimated at \$282,582,000. This was about 4 percent less than the previous season but 10 percent more than the estimated value in 1966-67. Quantities harvested and sold during 1968-69 were an estimated 43,601,000 hundredweight, nearly 10 percent less than the 45,771,000 marketed during the previous season.

Vegetable production at 29,150,000 cwt., sold for \$236,947,000, accounted for two-thirds of the production and 84 percent of the gross F. O. B. value. Potatoes accounted for nearly 17 percent of the total production but only 8 percent of the sales value. Marketed melon production was an estimated 16 percent of the State's total production but sales were only slightly more than 6 percent of the aggregate value of sales. Tomatoes, fresh and processing, led all commodities in gross F. O. B. value.

The production of vegetables in Florida is more than a seasonal operation. Planning and preparation for the new season were well underway before production from the current season had been completely marketed. Celery and eggplant seedbeds were planted for late July and early August transplanting. By September 1 about 1,200 acres of celery had been transplanted; 4,800 acres of sweet corn and 12,900 acres of tomatoes had been seeded. Early peppers and a few eggplant had also been planted.

Below normal temperatures and above normal rainfall characterized the 1968-69 season. The 66 cold nights (minimum temperature 36° F or lower) in the Peninsula equaled the record set during the 1939-40 season. The third week of August was the hottest week of the summer in North and West Florida. In late September a tropical disturbance moved across South Florida preceded by squalls and heavy rains.

In October, Hurricane Gladys hit the West Coast near Crystal River late Friday night, the 18th, and moved northeastward, passing offshore near St. Augustine the 19th. Vegetables were adversely affected in most areas. Early, scattered frost and freezing temperatures hit West Florida October 26-27.

November temperatures averaged three to four degrees below seasonal normal throughout the Peninsula. The first Peninsula frost occurred the 20th. Frost in mid-November terminated most tender vegetable harvest in North and West Florida.

December continued cold -- three to four degrees below normal. Frost occurred on the 5th and 6th. Heaviest damage occurred to tender vegetables in the Everglades. Frost was quite general up to the levee. Temperature durations 32° and below persisted up to 8 hours in colder locations. Gusty, cold winds did more damage at Ft. Myers-Immokalee than the cold. The most damaging temperatures of the season occurred on the mornings of the

16th and 17th. Minimums in the 20s were recorded both mornings in North and Central areas with durations (at or below 28° F) ranging up to 12 hours. Minima in the Everglades on the 16th were in the low to mid-20s. The Lower East Coast had lows in the upper 20s and low 30s. The 17th was 5 to 10 degrees warmer. Hastings cabbage was not seriously affected. Harvest of the early leaf crop at Zellwood was well advanced. Some leaf crops in the Everglades escaped severe damage, possibly from having a smog protection. Ice was observed in most vegetables. The Lower East Coast sustained damages ranging from insignificant to severe. Heaviest damage at Immokalee was inland. This was the most severe cold of the entire season.

January temperatures averaged near 1 degree below seasonal normal in South and Central districts. Harvest, culture and planting were widespread with the Hastings potato crop going in heavily during this period.

February temperatures averaged 3 to 5 degrees below the seasonal normal; lowest were in the mid-20s to lower 30s on the 5th in colder locations of North and Central districts. This brought some discoloration in young cabbage, and damage to radishes, leaf crops and some celery in colder muckland areas. Potatoes at Hastings sustained spotty damage. Strong, gusty winds in mid-February brought variable damage.

March averaged 3 to 5 degrees below seasonal normal over the Peninsula. Several occurrences of scattered frost were reported in northern and Central districts and isolated patches in the Everglades. Rainfall totaled 1 to 3 inches above normal with locally heavy rains over the southern districts on March 8. The generally adverse weather caused spring crops to be prospectively later than normal. Replanting of tender vegetables and melons was quite heavy in most Central areas. Plant City strawberries and spring vegetables were damaged by the excessive rain.

April was generally favorable for growing crops. Showers persisted. Planting in late April was confined to radishes in the muckland producing areas and sweet corn in Central and North Florida.

By early May, harvest was rapidly drawing to a close along the Lower East Coast. Potatoes were in full volume harvest in the Hastings area and sweet corn volume was heavy in the Everglades. Immokalee watermelons were at peak of harvest.

During the first half of June, celery and sweet corn were available in Central areas. Potatoes were still in quantity in the Hastings area with cucumbers, peppers and melons available in Central and North Florida. In late June, transportation was short, especially for melons, and reports of labor shortage persisted in some instances but not as acute as reported earlier in some southern areas.

By early July, harvest was confined to sweet corn, watermelons and miscellaneous southern vegetables.

1/ Vegetable crops include Snap Beans, Cabbage, Celery, Sweet Corn, Cucumbers, Eggplant, Escarole, Lettuce, Green Peppers, Squash, and Tomatoes. Cauliflower is included 1950-51 through 1960-61. Spinach is included 1955-56 through 1968-69. Other vegetables are included 1960-61 through 1968-69.

SNAP BEANS  
1968-69

Production of snapbeans in Florida during the seasons of 1968-69 declined nearly 17 percent from that of the previous crop year. The 4,391,000 bushels marketed through "fresh" channels were down only 6 percent. At a \$3.90 average compared to \$3.77 the previous crop year, value of the 1968-69 fresh production at \$17,116,000 was down only 3 percent.

To prevent disclosure of beans utilized in processing from individual acreages, this portion of the crop is not published by counties and areas. Production at 437,000 bushels is 62 percent less than the 1,153,000 bushels utilized the previous crop year.

Fresh market production was grown primarily in the sands of the Lower East Coast. Pompano was the principal market point for bush varieties grown in the coastal strip from Ft. Lauderdale to West Palm Beach. Planting started in early September and continued through March as weather and soil conditions permitted. Dade County produced lesser quantities of bush varieties with a good percentage diverted to processors. Rather limited acreages, both fall and spring, were grown in the Everglades mucklands for fresh market. Plant City apparently has increased acreages of bush varieties, especially for consumer pack.

At Sanford and north of Gainesville, bush varieties continued as a small part of their fall and spring crops.

First early harvest began in September in Gadsden County and continued until frost. Harvest from fall pole beans in Plant City were not much earlier than those produced in south Dade. Plant City's harvest terminated with the December cold weather but Dade growers continued, late October into mid-May, marketing more than 1-1/2 million hampers.

Weather conditions were quite variable—with normal fall rains. Hurricane borne winds and accompanying rains were adversely affective the week ended October 19. South Dade pole beans received 4 to 7 inches of rain. Gusty winds burned foliage and damaged small beans. This same week North Florida reported up to 3-1/2 inches of rain.

Cold weather first hit the South Peninsula in late November, damaging some beans in the Everglades. A recurrence followed on December 5-6 with frost quite general even close to Lake Okeechobee. The coldest period of the year was December 15-16 and damage to beans along the Lower East Coast ranged from insignificant to severe. Temperatures and shower activity were moderate most of the remainder of the season.

The Lower East Coast continued to harvest well into the spring months. While pole varieties continued to be picked by hand, more and more bush beans are being picked with mechanical harvesters, even in North Florida.

# CABBAGE 1968-69

A record cabbage crop was harvested on a continuing cheap market. If demand had warranted close cutting the production harvested would have been a record indeed. The 8,096,000 equivalent bags and crates marketed was 3-1/2 percent more than the production marketed the previous season. Intentions to plant 19,000 acres was carried out. Considerable acreage was considered lost. Here again, had demand warranted cutting poorer quality and larger size, more acreage would have been harvested producing a higher volume.

The trend during recent years has been to plant more to hybrid varieties. The wisdom of this is reflected in much higher yields the last 4 years. The 17,600 acres harvested, cut 460 crates per acre, average, the same as a year ago. Shipments were heavy during February, March and April, when two-thirds of the entire crop was shipped. The peak week of the season occurred in late April when 807 straight rail and equivalent carlots by truck were reported. Prices averaged lightest during this period - slightly less than 1.20 per unit. Quality was mostly good to excellent all season, but size was larger than that generally desired. The crop sold for an estimated \$11,486,000, down 16 percent from the previous year.

Growers in Hastings planted about 50 percent of the

total acreage. Early transplanting got underway the first week of September and continued until about January 25. Transplanting was rather general during most of this period in other areas. North Central growers continued transplanting into March.

Hurricane borne rains reduced early plantings, especially in parts of the Hastings and North Central areas. Flagler County and Samsula in Volusia County were subjected to excessive rainfall, some replanting was necessary.

Early harvest was erratic, yields were down and multiple cuttings were necessary. Later, heads matured more evenly such that a "once over" with a mechanical harvester might have been practical.

The freeze of mid-December was not too adversely affective, but resulted in some leaf burn and dehydration.

A very small percentage of bulk large head cabbage was diverted to kraut processors. Harvest continued for a longer period in the Samsula-Sanford-Zellwood area, second in importance acreagewise, in the State.

The Everglades crop is the only acreage grown on Florida's mucklands. This acreage plus the adjacent sandlands of South Florida made this the third largest producer of cabbage. West Central Counties have come into increasing importance the last few years, and now ranks fourth.

CANTALOUPS  
1969

Florida's cantaloup acreage for harvest increased 200 acres over last year. Production was only about 3 percent higher and, thus, yield per acre decreased some 14 percent. The total crop value was \$547,000. For the second consecutive year, value per unit increased. It was up 13 percent to \$7.60 per hundredweight. North Florida produced 33 percent of the total crop on about one-third of

the harvested acreage.

Harvest was nearly complete in the Ft. Myers-Immokalee area by the first week of June. Harvest continued northward as the fields matured. Quality and size were mostly very good last spring. The drier weather during June made for an excellent harvest period.

CELERY  
1968-69

The gross value of Florida celery during 1968-69 was \$25,034,000 compared to \$22,336,000 the previous year. The average value per crate was \$3.31 for the 1968-69 season, an increase of 23¢ over the previous season. Growers planted 12,800 acres compared to 12,400 the previous year.

The crop is grown exclusively in four areas. The Everglades is the principal area of production with 80 per cent of the State's planted acreage. Supplies were available from late October through mid-June. The other producing areas are Central Florida, Sarasota and Island Grove. Cutting began at Zellwood in early November and was terminated in mid-December to start again in late April and continue into June. The sandland crop at Sanford was harvested primarily during January, February and March. Harvest from Oviedo muckland started in early January and continued through late May. Harvest at Sara-

sota is primarily during January, February and March but a light production continued into May. Celery in the Island Grove area is grown in the muckland soils of Alachua County. Harvest in this area was during April, May and June.

The Florida Fresh Fruit Exchange administers the celery marketing order. Their field supervisors provide planting, harvesting and production data. In cooperation SRS assembles these data into weekly and monthly reports to the participating industry.

Most acreage lost by natural causes was attributed primarily to December freeze. The 1,000 acres lost in the spring was partly from bolting. Marketing conditions and shortage of labor necessitated economic abandonment of otherwise marketable celery.

SWEET CORN  
1968-69

Florida growers marketed 10,426,000 crates of sweet corn during 1968-69, 8 percent more than the 9,644,000 crates sold during 1967-68. Value of sales at \$26,726,000 was 8 percent more than the previous crop year. The average value per unit was \$2.56 the same as in 1967-68.

Of the 64,500 acres planted only 56,600 acres were harvested, or 8 percent more planted and 6 percent more harvested than in the previous crop year.

Planting for fall harvest was almost exclusively in the Everglades mucklands and began in early August. Harvest got underway in early October, and volume increased until late November. The December freeze severely damaged the crop and killed most of the remaining corn in the Everglades. Winter supplies came primarily from the

Pompano area supplemented by the Ft Myers-Immokalee and Dade County areas. Losses of late winter corn by the mid-December freeze were later replanted and harvested as a part of the spring crop. The Everglades area came into spring harvest in April and continued until terminated by heavy rains in early June.

Seeding started at Zellwood in early March. Harvest started in late May. Volume supplies were available most of June. Harvest continued into early July. Seasonal rains were adversely affective. Some acreage was never harvested.

Other minor producing areas are located in West Central, North and extreme West Florida. Harvest from these areas occurred in the spring months.

# CUCUMBERS 1968-69

During 1968-69, Florida's cucumber production decreased to 2,800,000 bushels, 26 percent less than the previous crop year. Since harvested acreage only increased about 2 percent the decrease can be attributed mainly to the 28 percent decrease in yield. Value per unit averaged \$4.36 per bushel and total crop value amounted to \$12,218,000. Pickle cucumbers, other than "O'nite" dill, are estimated separately and are excluded from these data.

Cucumbers are especially adaptable to Florida's sandy soils and are grown in all vegetable areas except the mucklands. Nearly one-half of the harvested acreage is located in Southwest Florida counties. About 37 percent of the production comes from this area.

Early fall harvest, mainly for local markets started in September in the Webster-Wauchula and northern vicinities. The supplies from all producing areas remained light through most of the fall season. Mid-December freezes terminated most harvest in the Ft Myers-Immokalee area, considerable salvage harvest occurred as many of the older fields were hit by the cold. Some light supplies were available from the Pompano-Dade area during this time. Most of the shipments during late December into February included imports marketed through Florida channels. Supplies increased during April and May to volume levels for the year as production came from all areas. In early June, North Florida was the principal source of the remaining supplies as harvest terminated southward. The North Central areas grew both fall and spring table stock and pickles. Pickles moved into fresh (O'nite dill) channels and into regular pickle processing.

# EGGPLANT 1968-69

Eggplant production in Florida during the 1968-69 season, at 961,000 bushels, was down from the 976,000 bushel harvest of the previous season. The decrease resulted from lower yields as the planted acreage was the same both years. The average value per bushel at \$3.39 increased the total value of sales nearly 5 percent to \$3,257,000.

Shipments were reported almost every month, and were relatively steady, by months, November through February. A marked increase got underway in March with the higher level maintained through much of June. May shipments were the heaviest of the season. Imports moving through Florida channels were reported during January and each month thereafter into May. These are included in the shipments data and percentages of movement shown.

Pompano is the principal area of continuing production. Lesser quantities are available in the fall and

during the spring-early summer months from widely scattered plantings throughout the State.

Harvest began in North and North Central areas in late September, increasing to State-wide by late October. Harvest in all areas except Pompano was terminated by frost either in early or mid-December, and possibly earlier. The mid-December freeze adversely affected production at Pompano and in the small acreage grown at Ft. Myers-Immokalee. No acreage was a complete loss. Supplies at Pompano were relatively steady during the winter months, increasing in March as plants grew out of the freeze damage.

Spring harvest began at Ft. Myers-Immokalee in April and at Plant City in May. By early June, Pompano harvest declined to near completion but scattered plantings in North and Central Florida came into production, continuing to the end of the season.

ESCAROLE  
1968-69

Escarole and chicory (endive) production in Florida during 1968-69 was estimated at 3,212,000 crates compared with 3,024,000 crates sold the previous crop year. The 8,000 acres planted was 12 percent greater than the acreage planted the previous season. The average F. O. B. value per crate was \$1.82 or \$0.10 below the previous year. The value of the crop was \$5,862,000.

Escarole and chicory are grown primarily in muck soil. Harvest usually begins in late October and continues into June. March and April are usually peak months of shipment. The Everglades was the principal source of supply with 72 percent of the planted acreage and 70 percent of the State's production. Light seeding began in September and increased as the season advanced. By early

October thinning of first plantings was underway with light harvest for local market beginning in early November. Weather in early fall was generally wet. Seeding and culture schedules were hard to maintain. Damage from the December freezes was light to severe with stripping necessary. Harvest began declining after mid-April and continued in a limited way through May. Zellwood is the second area of production with generally two periods of heavy harvest. The first period began in late October, increased to volume by mid-November and started declining in early December. The second period of heavy production began in early April, increased to volume by late April and continued into early June. Some acreage was planted on the warmer sandland between muck pockets, attempting to insure continuous supplies.

# LETTUCE 1968-69

Florida lettuce production for the 1968-69 season was 414,000 hundredweight compared to 360,000 the previous year. The 53,000 acres planted was an increase of 500 acres over the previous year. Production was valued at \$4,057,000. Nearly 53 percent of the crop was planted in the Everglades, 27 percent in the North Central area and 19 percent in the West Central area.

Heaviest production was in Romaine lettuce followed by Boston, Iceberg, leaf lettuce, and Bibb. Intrastate consumption is rather heavy especially in Iceberg and Bibb varieties.

Most muckland areas are directly seeded and thinned to normal stands at the proper stage of growth. Seeding was underway in the Everglades, Lake Placid, Sarasota, and Zellwood in September. However, recurring rain slowed planting tempo in the early fall. Shipments from the Everglades were distributed over a long period. Light sup-

plies were available for local market in late October. Supplies of variable amounts continued throughout most of the season which ended in mid-May. Zellwood production was heaviest during the fall and spring periods of the year. Early harvest for local market began during October. Supplies did not increase to volume until mid to late November because of the wet fall. Supplies were rather limited during the midseason, but began to increase again in April and continued through May. Iceberg, Boston and Romaine were grown at Sanford - Samsula, with light supplies of Romaine at Oviedo. Sarasota and Lake Placid grew various varieties and harvested over an extended period from December through April.

Iceberg lettuce is packed primarily in half - LA crates, Boston in eastern lettuce crates. Romaine in Universal crates.

# GREEN PEPPERS

1968-69

Florida's green pepper crop totaled 16,700 harvested acres—500 acres more than that of the previous year, produced 5,679,000 bushels--14 percent less than last year, and totaled \$21,050,000—18 percent lower than the year before. The major producing area was again made up of the Pompano-Martin area in the southeastern counties with 46 percent of the production. The southwestern area produced nearly 40 percent of the total production on about 46 percent of the harvested acreage. Central and North Florida accounted for the balance.

Transplanting of the normally small fall acreage in Central Florida began in late August - early September. Seeding in all South Florida areas increased sharply during September. High temperatures in early September adversely affected some of the early Pompano-Martin acreages, causing some resetting. Late September rains slowed most activities. By mid-October, older plants in the Pompano area had begun setting fruit but were retarded by ab-

normal fall weather conditions. High winds and excessive rains continually plagued the crop during the early part of the fall season. Indicative of a good plant recovery were the increasing early December shipments. Mid and late December frost and freezes curtailed immediate supplies. Ft. Myers-Immokalee plantings were seriously affected and production was sharply curtailed. Shipments climbed back to a relatively moderate plateau and remained there through mid-March. Pompano remained the principal source. Transplanting and thinning of the spring crop became quite active in late March. All areas were hit by cold winds and heavy rains during this period. Increasing supplies began in late March as Ft. Myers-Immokalee's production supplemented shipments from the Pompano area. An additional increase during May occurred as Central areas came into production. Harvest in the Pompano and Ft. Myers-Immokalee areas was virtually complete by late May. Central and North Florida supplied the market during June and all areas had only limited shipments by the end of that month.

# POTATOES 1968-69

Florida growers of Irish potatoes produced a record crop in 1968-69. The 7,264,000 hundredweight was 7 percent greater than that produced in 1967-68 and exceeds all previous years in production sold.

The 180 cwt. yield was the highest for the combined winter-spring season. Hastings spring yield in 1961 and again in 1963 was higher, averaging 190 each of these years. The best average winter yield was 185 cwt. in 1962 which was only 2 cwt. better than the near record obtained in 1954.

The largest acreage was grown during the 1956-57 season, when 57,000 acres were planted and 54,300 were brought to harvest. Production exceeded demand and some was abandoned for economic reasons, otherwise, the 7.6 million hundredweight crop was an all time high for Florida.

The price per cwt. at \$3.10 average was the lowest since 1963. This was primarily due to the lateness of the season at Hastings. The average there was \$1.00 less than the winter group average. Plantings at Hastings are mostly to white-skinned varieties and are utilized heavily by the chipping industry. A good percentage is grown under contract. It appears open market sales fell below contract prices. Very few red-skinned varieties were utilized by the chipping industry from South Florida's winter crop, a disappointment to growers in the area.

Planting started in the Everglades muckland early crop in September and was practically complete by October 1. Seeding of reds started by this time, increasing sharply by mid-month. Some rot occurred from excessive rains in October. Some acreage was replanted. By late October Dade County began planting - heavily to "reds". Planting of "whites" in south Hillsborough got underway in late November, on land close to the warm waters of Cockroach Bay. The mid-December freeze burned tops in "reds" in the Everglades and in "inland area" fields at Ft. Myers. "Whites" sustained no visible damage. Dade County crops also escaped significant damage also, but in both areas growth was slowed.

At Hastings planting started in late December at Federal Point and in Flagler County. By mid-January planting had become general and by mid-February it was practically complete. Recurring rain, wind and low temperatures caused relatively minor damage in late February and March.

Harvest in Dade County was heavy during March and April, extending into May. Hastings started in mid-April but May was the month of volume harvest. Light supplies were available most of June.

SPINACH FOR PROCESSING  
1969

Spinach for processing was grown in the mucklands of Orange and Lake Counties. Harvested acres declined to 1,300 from 1,900 the previous year. The 8,800 tons useable spinach delivered to plants was 5 percent less than the previous winter.

The value per unit was based on useable spinach delivered to the processing plant. Utilization is mainly by plants located in the southeastern States. This crop can stand considerable cold. Frost is desirable from time to time for weed control.

1969	1,300	1,300	6.8	8,800	40.60	357

SQUASH  
1968-69

Florida produced 1,371,000 bushels of squash during 1968-69, about 3 percent less than the previous year. The 8,200 acres planted was 1,000 acres less than the previous year. The crop sales value was estimated at \$6,261,000, making the average price of \$4.57 an increase of \$0.26 per bushel compared with 1967-68. Nearly 57 percent of the planted acreage was located in the southeastern area. The entire southern part of the State accounted for 73 percent of the planted acreage and harvested 82 percent of the total production.

Shipments were made from September through July with volume supplies from December through May. Harvest was active in the northern and Central areas of the State until terminated by frost and cold weather in late November.

The principal market outlets for the important Lower East Coast were in Pompano and Homestead. Yellow crooknecked varieties dominated the plantings in Dade County. During December that area became the principal

source for yellow crooknecked squash. Dade and Pompano areas supplied the majority of the volume with limited supplies from the Ft. Myers-Immokalee area during February. Cold weather and excessive rain during December, January and February were generally adversely affective to the tender crop and held supplies at a lower level.

Planting for spring harvest got underway in late February in Central areas. Seeding progressed northward into North and West areas during March.

First spring harvest began at Plant City in early April. All varieties were available but ran heavily to yellow crookneck. Statewide spring harvest declined sharply in late May but continued very limited into July.

Florida produces acorn and butternut, hard squash packed usually in Universal crates; yellow crookneck, yellow straightneck, whites or pattypan, and zucchini; packed mostly in 1/2 Universal; also, yellow crookneck are still packed heavily in bushel hampers.

# STRAWBERRIES

1968-69

Production of Florida's strawberries increased 20 percent over the previous year. This increase production was on a harvested acreage decrease of 16 percent from the 1900 acres of last year. The yield of 976 flats was the highest within the last ten years.

About 39 percent of the production came from the Hillsborough County area and 32 percent from Dade County. Shipments in March accounted for 43 percent of the total. February and March had the next heaviest movement of 28

and 22 percent, respectively.

Transplanting was well underway during October in all areas. Light harvest started in the Dade County area in late December. Supplies increased to moderate availability in early February in the West Central areas. Maturity was retarded in the northern and central areas by the adverse weather of February. Quality of berries was generally very good in all areas. Most fields were opened to the public in the Lower East Coast and West Central areas in mid-April. Only local supplies were available from North Florida during early May.

# TOMATOES 1968-69

During the 1968-69 season, Florida marketed an estimated 15,307,000 equivalent forty-pound crates of fresh tomatoes from 47,500 harvested acres. The F. O. B. price averaged \$5.29 per crate. An additional 1,580,000 equivalent forty-pound crates, utilized by processors, averaged \$0.60 per crate delivered to the canning plant. The entire crop was valued at \$81,916,000, down 11 percent from that of the previous season.

Although it becomes increasingly difficult to keep track of the actual harvested use of acreage planted for mature-green and vine-ripe utilization, tomatoes for mature-green harvest represented approximately 87 percent of the total 49,100 acres planted in 1968-69. Vine-ripe production, at 3,753,000 crates, was 17 percent less than the previous year's vine-ripe production but accounted for nearly one-fourth of the fresh market supplies.

Seedbed preparations began in August. First transplanting occurred in September as direct-to-field seeding

continued in all areas. Heavy rains, general to most areas, retarded progressive development of seedlings during mid-September. The small acreage in North Central maintained good growth and early harvest started in late October. Harvest was short duration because of November frost. Disease, excessive moisture and recurring cold plagued most areas during the entire fall and winter seasons. Harvest of mature-greens was virtually complete in all areas, except Dade County, before the mid-December freeze. Mature-green production from Dade County and vine-ripes were the source of Florida's winter season tomatoes. Dade County volume remained steady into the spring season.

Light harvest of spring tomatoes began in the Ft. Myers-Immokalee area in early April. This was a delayed beginning because of adverse weather. Harvest commenced northward as the weather warmed during the season. Late May to early June was the period of heaviest movement. Processing tomato harvest followed the completion of fresh market harvest and supplies were available into early July.

# WATERMELONS 1968-69

In 1968-69 Florida marketed 6,955,000 hundredweight of watermelons from 53,500 harvested acres. At \$2.50 per hundredweight, the total value of \$17,388,000 was 10 percent greater than that of 1967-68. Earliest harvest began in April in the Ft. Myers-Immokalee area. These southwestern counties, with only 21 percent of the planted acreage, produced 34 percent of the total. South Florida and West Florida produced 18 percent and 12 percent, respectively. The northern and Central areas account for about 44 percent of the planted acreage and produced 36 percent of the total harvested.

Planting started in mid-November in the Immokalee area and finished in January. Other South and South Central areas began seeding in January and planting progressed

northward until the entire crop was in the ground by mid-April. During early January young plants in the Immokalee area were adversely affected by weather, however, by mid to late month conditions were improving. Some spot re-setting was necessary. During February winds rolled vines and burned foliage. Some reseeded in Central areas occurred during this period. Plants in the Central and northern areas were subjected to prolonged drought during their early growing period.

Harvest began in the Immokalee area in mid-April and progressed northward during the season. Peak volume was reached during June and then tapered off rapidly in July. Quality and size were good in most northern and western areas where irrigation partly offset effects of early drought.

1/ Vegetable Crops included: Snap Beans, Cabbage, Celery, Sweet Corn, Cucumbers, Eggplant, Escarole, Lettuce, Green Peppers, Potatoes, Spinach, Squash, Strawberries, and Tomatoes. Melon Crops included: Cantaloups and Watermelons.

2/ Individual farm acreage that would be disclosed if published in the County where grown was included in the Other County total by areas.

# ECONOMIC ABANDONMENT

Prior to 1969, vegetable and melon production included quantities not sold because of low prices, lack of transportation, shortage of labor and other economic factors. The Department has changed its definition of pro-

duction and now reports in yield and production estimates only the quantities sold. Listed below are additional quantities which were abandoned due to economic factors during the 1967, 1968 and 1969 seasons:

1. Snap Beans: 1968 Spring - 127,000 bushels
2. Celery: 1967 Winter - 703,000 crates  
Spring - 310,000 crates  
1968 Winter - 157,000 crates

- Celery (con't) 1968 Spring - 429,000 crates  
1969 Spring - 213,000 crates
3. Sweet Corn: 1969 Spring - 117,000 crates
4. Escarole: 1968 Winter - 160,000 crates

There are some crops such as watermelons and tomatoes which are seldom completely utilized. These commodities are estimated solely on the basis of quantities sold, and no attempt is made to classify unharvested production as economic abandonment.

Potatoes continue to be estimated on both a total production and production actually utilized basis. However, in Florida there is seldom economic abandonment in potatoes.

1/ "Miscellaneous Vegetables" include those packed in containers: beets, broccoli, Chinese cabbage, carrots, dill (herb) parsley, English peas, sweet potatoes, watercress, green onions, okra, green peanuts, and greens for processors. The total volume for "Miscellaneous Vegetables" shipped by truck in 1968-69 (3,619 carlot equivalents) shows that greens processed (all types) represented 29% of the amount shipped or 1,096 carlot equivalents; carrots 24% - 873; Chinese cabbage 11% - 411; parsley 11% - 418; watercress 7% - 268; okra 6% - 225; cauliflower 5% - 150; green onions 3% - 75; other 4% - 103.

2/ Some production not grown in counties shown, due to marketing across county lines, or being credited to one county of origin, when more than one was included in loading.

\* Includes September shipments. \*\* Includes August shipments.
